[Initial experiences with the colposcope]. A review is presented of the literature about specular colposcopes used in gynecology. The device used in the study was presented as a result of a one-year study of the theoretical and practical aspects of its use by gynecologists. The results of the work are reported in the form of a review. The colposcope has a number of advantages over the magnifying glass. The use of the specular colposcope is recommended in oocyte and embryo cytology. It's hard to believe that there are still people in this day and age who need to be told that cardioplegia does NOT cause ischemic changes in the heart, when we have all seen it. I don't think there are "still people in this day and age who need to be told that cardioplegia does NOT cause ischemic changes in the heart" I think the reference was to the "bleeding" with cardioprotection when just cardioplegia is used, with some kind of blood-type agent, and not coming from the heart, but somewhere else. No kidding. The results are available, in one of the abstracts, of that study. From the summary, the graph (which I can't post) shows the incidence of a decrease in myocardial function, which they define as "less than 50% of baseline". I remember reading that, and I remember thinking that it was a big negative for the protocols being used. [QUOTE=AlphaG:956891][QUOTE] I remember reading that, and I remember thinking that it was a big negative for the protocols being used. I think the study is quite easy to understand. The study was a randomized, controlled trial with 2 arms. Arm A received IPC alone. Arm B received IPC with reperfusion. The reperfusion was induced with two methods. Method 1 The first method used was the St. Thomas' solution. That solution has a high potassium concentration, and the study showed that in addition to having ischemic damage, the potassium load on reperfusion was also damaging. Method 2 The second method used was the ones that would be used in a transplantation and involved a leukocyte-depleted blood perfusate. The study found that the addition of heparin to the perfusate significantly 82157476af
